

Dashboard Design

Date	25 August 2026
Team ID	Individual Project
Project Name	Food Ordering Behavior Dashboard
Maximum Marks	5 Marks

Activity 1: Interactive and Visually Appealing Dashboards

The Food Ordering Behavior dashboard applies the required dashboard design principles through a clear layout, suitable visualizations, consistent colours, filters and KPI summaries.

Figure 1: Food Ordering Behavior Dashboard

Dashboard Design Features

- **Clear and Intuitive Layout:** KPI cards are placed at the top, followed by charts in clearly separated sections.
- **Use Appropriate Visualizations:** Bar charts compare cities, age groups and meal types; donut charts show distributions; the heatmap compares city and cuisine.
- **Colour and Theming:** A consistent warm background and repeated chart colours create a unified visual theme.
- **Interactive Filters and Slicers:** City, Cuisine and Meal Type filters allow users to focus on selected data.
- **Drill-Down Capabilities:** Orders can be viewed across age groups, company/restaurant types and meal types.
- **Responsive Design:** The dashboard keeps KPIs and multiple visuals visible together for quick analysis.
- **Custom Visuals and Icons:** KPI cards, data labels and section headings emphasize key information.
- **Use of Infographics:** KPI summaries and percentage labels give quick visual information about orders and preferences.

Major Outcomes

- The dashboard shows 50,000 total orders, an order value of 27.39M and delivery fees of 2.98M.
- The average customer rating shown is 2.99.
- Mumbai has the highest order volume among the displayed top five cities, with 8,443 orders.
- Breakfast has the highest displayed order value at 11,83,066, followed by Dinner at 11,44,561.
- Cuisine preferences are closely distributed, with each displayed cuisine contributing about 16.6%–16.7%.

- Millennials and Gen Z are the largest age groups in the displayed order-volume chart.
